Brand New Book ***** Print on Demand *****.Excerpt from Dielectric Constant, Power Factor, and Resistivity of Rubber and Gutta-Percha A rubber-sulphur mixture vulcanizes more readily if there has been added to it a small quantity of any one of a certain group of compounds called accelerators. These accelerators are not merely catalysts since they may also markedly modify the nature and properties of the resulting vulcanized rubber. By their use the time and temperature of vulcanization have less influence on the resulting product. Hence by employing accelerators a greater uniformity in vulcanized rubber can be obtained. For many purposes the properties of rubber can be improved by adding some inert material called a filler. Fillers may be used in any proportion from 0 to 90 per cent. The rubber, filler, and sulphur are mixed together before vulcanization. The vulcanizing process does not change the chemical nature of the filler. However, the mechanical and electrical properties of the rubber may be greatly modified by its presence. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books.
