This item is printed on demand - Print on Demand Neuware - The association between social class and psychiatric disorder has been one of the central topics of socio-epidemiological research since its inception. With remarkable consistency, numerous investigations have demonstrated an inverse correlation between social class and prevalence rates for most forms of psychopathology. The debate on the interpretation of these findings - social causation versus social selection processes - continues to this day. Moreover, the question as to what the psychosocial processes are through which social class and individual psychopathology are mediated has remained mostly unanswered. The concept of social stress may well provide new insights in this regard. One should note, in particular, the considerable conceptual and methodological progress made in life event research. Recently, the first attempts have been made to link the two concepts of social class and social stress. These developments will be retraced in this book in the light of new investigations. Descriptive epidemiological studies on the relation between social class and psychiatric disorders form the point of departure. Explicit reference is made to two classical studies in psychiatric epidemiology:...
