Not illustrated. 1907 Excerpt: .recorded without the employment of any relay whatsoever, the amount of current delivered by the detector being ample to record large signals even with a moderately insensitive direct writer. The advantages of our detector are great sensitiveness together with great current changes, allowing the recorders to be operated directly without the employment of any relay. The detector is moreover extremely robust and cannot easily be damaged: the instrument is self-operating, works with extreme rapidity, will record as fast as any operator can send, and is practically everlasting, as it is very rarely that the peroxide pellet need be changed. As regards sensitiveness, on a 185 feet aerial signals have been received and recorded over 100 miles; this, it must be remembered, with the detector coupled directly to the aerial and to the earth-plate. No receiving transformer is used, the detector being coupled direct to the aerial, as before stated. The chemicals of the detector are carried in a brass case, together with a switch, so that on sending in the station, the chemicals can be disconnected from the outside circuit by turning the switch and completely isolated. Production of Continuous High Frequency Currents for Use in Transmission.-- Mr S. G. Brown has recently patented a method of producing uniform current jigs, of which the following is a description: -- The positive electrode, as will be seen from the figure, consists of a disc of metal, preferably aluminium, which is kept slowly rotating, the negative electrode consisting of...
