Excerpt from Contributions to the Study of Coal: A Proposed Simplification of the Parr Unit Coal Formula, Ash-to-Mineral Matter Correction in Coal Analyses, Unit Coal as a Basis of Coal Standardization as Applied to Illinois Coals When coal is burned, the mineral matter is converted into ash, involving changes in composition and quantity and certain thermal effects. Of these, the loss in quantity due to the release of water of hydration and to the conversion of pyrites to iron oxide, and the heat effect due to the combustion of the pyrites, are the most important. The heat effect and the quantitative effect due to the change of calcium carbonate to calcium oxide, although appreciable when considered by itself, may be neglected in calculations of pure coal values,⁶ except in the infrequent cases of the occurrence of calcite in coal in quantities greater than 1 per cent. Other quantity and heat effects are so small that they may be neglected and yet not affect the calculation to an amount approaching the allowable experimental errors.
