Reviews

A brand new electronic book with a new standpoint. It is written in basic phrases rather than confusing. It has been designed in an extremely basic way which is merely right after I finished reading through this publication where it basically altered me, change the way I believe.

Forgotten Books, United States, 2015. Paperback. Condition: New. Language: English . Brand New Book ***** Print on Demand *****. Excerpt from **The Human Frame and the Laws of Health The Skeleton (a) The Structure of Bones and Cartilages.** - The bones, collectively called the skeleton, serve as a supporting framework to the rest of the body. To fulfil this role two things are required in a bone: firmness and a certain degree of elasticity. Its component parts are likewise two: an organic part, the bone-matrix; and an inorganic part, the bone-ash. If a bone be placed in dilute hydrochloric acid, the mineral substances are dissolved away, and it becomes soft and flexible. So treated a bone retains its shape, though it consists only of the organic part. By burning, the organic part of bone is destroyed, and a white, friable mass, the bone-ash, also retaining the shape of the bone, is left. The inorganic constituents, which make up about two-thirds of a dry bone, consist mainly of phosphate of lime, 56 percent.; carbonate of lime and other mineral salts, 13 percent. The rest, 31 percent., consists of organic matter. These proportions, however, vary in different bones, and in a given bone at different periods of life (see Table II. p. 94). Most bones are formed from cartilage, which gradually gives place to bone by a series of changes, which include the deposition of mineral matter. In the young state, before these changes occur, the cartilage-masses which are being changed into bone are incapable of supporting heavy weights, or of resisting strong pressure of any kind.
