Particles of medium and fine sand begin to move across the soil surface in a series of bounces or by rolling or creeping. Where they strike unprotected soil they loosen other particles which are then swept across the ground surface and cause still further erosion. Finer particles are sometimes carried high into the air and may float for days before settling. The damage done by wind erosion has serious short and long-term effects. The most notable short-term effect is that of reducing or eliminating stands of crops. One storm can completely destroy young cotton. A visible effect of erosion is the piling up of sand or silt on highways, railroad rights-of-way, and around buildings on farms and in urban areas. This material must be removed at great expense. Another visible effect of wind erosion is the duning of sand in cultivated fields, making them impractical to till for crop production. Perhaps the...
