Forgotten Books, 2017. Paperback. Condition: New. Language: English . Brand New Book ***** Print on Demand *****. Excerpt from Measuring the Sugar in Maple Sap and Sirup Maple sap and maple sirup are water solutions consisting mostly of dissolved sugar plus a very small amount of other material (such as salts of organic acids). The densities of sap and sirup. Which vary with the amounts of dissolved solids, are usually expressed in terms of degrees Brix (percent sugar). The density of all maple sirups must be maintained within very narrow limits. Corresponding to a range of only 1.5 Brix Brix). If the density is below Brix. It will not meet minimum State and Federal standards. It will taste watery (having a viscosity of less than 164 centipoises at 68 and it will be more conducive to microbial growth. Sirup with densities above 67 Brix are supersaturated at room temperatures and will tend to crystallize on storage. Forming unattractive crystalline deposits (rock candy) in the container. More important. These heavy sirups reduce the amount of sirup that could be produced from a given sap crop and result in a loss of income for the sirup producer. The measurement and adjustment of the density of all maple sirups that are for sale. There fore. Is an absolute requirement. The measurement of the density of maple sap is likewise important since it is from the known sugar content of the sap that sirup yields can be calculated. Since sap is becoming a marketable commodity whose value is based upon its sugar content. The precise measurement of its true sugar content in degrees Brix becomes essential. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at This book is a reproduction of an important historical work. Forgotten...
