

Geological Survey professional paper Volume 429

Filesize: 7.19 MB

Reviews

Basically no phrases to spell out. It is actually rally interesting through studying time. You can expect to like just how the article writer create this publication.

(Braden Leannon)

GEOLOGICAL SURVEY PROFESSIONAL PAPER VOLUME 429

To download **Geological Survey professional paper Volume 429** PDF, you should refer to the hyperlink under and download the ebook or get access to additional information that are in conjunction with GEOLOGICAL SURVEY PROFESSIONAL PAPER VOLUME 429 book.

RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 174 pages. This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1949 Excerpt: . . . epidote, magnetite, and rutile. Apatite is perhaps the most abundant, but two kinds of zircon are also present, a colorless and a pink variety. The colorless variety occurs as euhedral crystals and as well-rounded grains. The pink zircon is the more abundant and shows hardly any effects of abrasion, being in short prismatic crystals with pyramidal terminations. Pink zircon from sandstone of the Harmony formation in the Antler Peak quadrangle has been determined to be 958 million years old (Jaffe and others, 1959, p. 130). Additional heavy mineral species are undoubtedly present but most of the sandstone is very difficult to break down to sizes that permit satisfactory separation. A specimen of calcareous sandstone was disintegrated with acid, however, and the following additional minerals were observed: monazite, dumortierite, cassiterite, ilmenite, pyrite, pyrrhotite. The grains of monazite are both rounded and euhedral; the dumortierite and cassiterite are euhedral or angular. Modal composition of some typical sandstone specimen are given in table 3. A. Grains range widely in size and angularity; some edgewise flakes of B. Loosely packed grains cemented by finely crystalline calcite. muBcovite in a matrix of quartz, sericite, and chlorite. O. Closely packed grains ranging widely in size, in a sericite matrix. D. A quartzitic variety composed of tightly packed angular grains with almost no distinguishable cement. PHOTO MICROGRAPHS OF FELDSPATHIC SANDSTONE OF THE HARMONY FORMATION. Unlabeled grains are mostly quartz; others are plagioclase (P), orthoclase (or), microcline (ml), and flakes of muscovite (M). Crossed polarized light The...
