Not Avail, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1912 Excerpt: .rather small, no doubt f-inch distribution bars placed about 12 inches apart will be sufficient to meet the stress. Checking this amount by the usual formulae we get: $--d = 5.2$ $--f$ (as these bars will be placed on top of the cross bars) = 4-83, $a = 0-14$, and $b = 12$. Hence This shows that with the above arrangement both the steel and concrete will be well understressed. The full thickness of the slab, including the bottom cover, will be 6 inches. Sides of Tank.--If the length of a side is less than 1 time its height, and the angles are securely tied together, the greatest tendency to burst will be in a vertical direction, and horizontal reinforcement will be required similar to the walls of Examples XIII. and XIV. The vertical distribution rods if placed about 12 inches apart will be sufficient to take the stress in the opposite direction. When the length exceeds 1J time the height, the support from the return walls can be neglected, and each side considered in the same way as the wall of Example XII., the reinforcement being vertical with horizontal distribution rods about 12 inches apart. In either case the angles must be well tied together, and the sides well tied to the bottom. The latter method will be the one for the present example. The pressure against the sides at any depth will equal the vertical pressure at the same depth; therefore the pressure...
