Createspace Independent Publishing Platform, 2017. Paperback. Condition: New. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.The Trump Administration has taken several actions intended to help revive the U.S. coal industry. Within its first two months, the Administration rolled back or began reversing several coal-related regulations finalized under the Obama Administration. This effort was undertaken as three of the largest coal producers continued recovery from Chapter 11 bankruptcy, and occurred in the context of higher coal prices (making coal production possibly more profitable), lower inventories, and higher natural gas prices-factors that could lead to coal being more competitive as a fuel source for electricity generation. Coal will likely remain an essential component of the U.S. energy supply, but how big will its footprint be? U.S. coal production had been strong since the 1990s (above or near 1 billion short tons per year until 2014), and reached its highest level of production in 2008 (1.17 billion short tons). But it declined precipitously in 2015 and 2016. The Energy Information Administration's (EIA's) current data and short-term projections show coal production remaining under 800 million short tons in 2017 and 2018. Long-term EIA projections show that coal production is likely to fall below 600 million short tons per year, assuming implementation of the Obama Administration's Clean Power Plan (CPP). Without CPP, coal production is expected to remain relatively flat, at around 800-900 million short tons per year through 2050. As a result of societal concerns, among them the desire for cleaner air, coal consumption may have peaked. But in either case (declining or flat demand), coal is a smaller share of the total U.S. energy pie. Power generation is the primary market for coal, accounting for about 93 of total consumption. With the retirement of many coal-fired power...
