For a general formula, then, we may use the fraction k, and then, assume for particular classes of localities, a mean value of k, provided the variation of humidity in any proposed class of localities is not too great. Using the general value, k of the humidity, we may correct the reading of the barometer so that it may be used in the formula for density, as follows: Let p be the reading that would, if produced by dry air, pertain to the actual density for which a barometric reading p is recorded; then, pv being the vapor-pressure at the time, P = P. + Pv = P-fPv = P-kF (4) For a barometric pressure p , for dry air, we have from (2) d p 492 lb) Using with this formula the values of the readings for standard conditions; viz: bar: 29.5275; ther. 59;...
