PRACTICAL PHYSICAL CHEMISTRY

Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1916 Excerpt: .to the bench. The bomb is then connected at E with an oxygen cylinder and pressure-gauge. The valve F is closed, and the valve on the oxygen cylinder opened slowly; then slowly admit the gas to the bomb by opening F. When the pressure reaches 25 atmospheres with F well open, close the valve F tightly, and then shut off the oxygen cylinder and disconnect. The water-jacket of the calorimeter should be filled with water several hours before the experiment is to be done., Weigh out into the calorimeter about 2-5 kgs. of water (sufficient to immerse the bomb up to the nut B). The calorimeter is then placed in position, being insulated at the bottom by a wooden block or cork. To counterbalance the loss by radiation, the water in the calorimeter should be at a slightly lower temperature than that of the room--such that the temperature of the room is the mean between the initial temperature of the water in the calorimeter and the highest temperature of the experiment. The total rise is usually about 3, therefore the initial difference should be about 1-50. The bomb is now carefully lowered into the calorimeter and the terminals connected to the battery, the circuit being broken by a switch key. Insert the Beckmann thermometer and commence stirring. After about five minutes, temperature on combustion, record the reading every minute for about eight minutes. At the eighth minute complete the electric circuit thereby causing the ignition to...
