Forgotten Books, 2017. Paperback. Condition: New. Language: English . Brand New Book ***** Print on Demand *****. Excerpt from The Inorganic Constituents of Marine Invertebrates Although many analyses of corals and molluscan Shells are on record, some important groups of organisms have received only slight attention, and little has been done heretofore toward determining the composition of their tests or skeletons. The few published data, more over, have been generally but not always incomplete in certain particulars, especially with regard to the localities from which the specimens analyzed were Obtained, the depth of water in which each creature lived, and the temperature of its habitat. Even in our own work some of these details are lacking, but their great significance when known is strikingly evident in the study of such groups of animals as the echinoderms and alcyonarians. Furthermore, some of the older analyses are unsatisfactory for other reasons, for many of them were made to determine Single facts, such, for instance, as the proportion of magnesium carbonate alone; and in others such essential constituents as organic matter were not taken into account, an omission that is especially serious, for it renders the accurate comparison of the analyses with others impossible. In the shells of mollusks the proportion of organic matter is small, but in the echinoderms, alcyonarians, and phosphatic brachiopods it is relatively large, ranging from 10 to even 40 per cent or more. This statement, however, must not be misconstrued; it refers, of course, only to the specimens, dried or alcoholic, which were actually analyzed. In order to compare the analyses, therefore, so as to determine the true composition of the inorganic Shells or skeletons, the very variable amounts of organic matter must be rejected, and the remainders recalculated to 100 per cent. Relations then appear which are...
